

Overview

This document outlines recommended improvements, structural enhancements, and technical polish for the S.I.C web platform following the integration of the Gallery page and unified navigation updates.

Technical & Code Base Enhancements

Area	Current Implementation	Proposed Improvement	Impact
Media Assets	Text placeholders ([Photo Placeholder])	Replace with responsive, optimized WebP images (<picture> tags)	Improves visuals and loads faster
Navigation Dryness	Hardcoded HTML <nav> on every file	Modularize header/footer using JavaScript or a server-side include	Eliminates manual multi-file updates
Map Integration	Text placeholders in contact.html	Embed interactive Google Maps or responsive SVG/CSS map blocks	Enhances user experience on Contact page
Form Processing	Static demo forms with client-side script	Integrate API endpoint or email service (e.g., Formspree / Netlify Forms)	Enables real enquiry submissions

Key Feature Upgrades

- **Lightbox Gallery View**
 - Add lightweight JavaScript lightbox functionality to gallery.html so users can click on photos to view full-resolution screening captures and captions.
- **Dynamic Fixture Filtering**
 - Implement category filters (e.g., *All*, *Formula 1*, *Football*) on services.html and gallery.html to help users quickly sort content.
- **Live Booking Link Integration**
 - Add direct external action buttons linking to Ster-Kinekor's ticketing gateway for each individual fixture listing.

Accessibility & Performance Polish

- **Image Accessibility:** Ensure all replacement images include descriptive alt text (e.g., alt="Fans watching F1 live broadcast at V&A Waterfront cinema").
- **Color Contrast Audit:** Verify contrast ratios on CSS custom properties (--panel, --line, --blue) against dark backgrounds to meet WCAG AA standards.
- **Lazy Loading:** Apply loading="lazy" to all gallery images below the fold to optimize initial load times.
